

## Problem Set 7

Due: April 3

### Reading:

- Chapter 9. *Directed Graphs* 9.5 through 9.6, and 9.8 through 9.11 (omit 9.7) in the course textbook.
- Omit Chapter 10 in the course textbook.
- Chapter 11. *Simple Graphs* through 11.4 (omit 11.5) in the course textbook.

### Problem 1.

Let  $R$  and  $S$  be transitive binary relations on the same set,  $A$ . Which of the following new relations must also be transitive? For each part, justify your answer with a brief argument if the new relation is transitive and a counterexample if it is not.

(a)  $R^{-1}$   $aRb \text{ \& } bRc \Rightarrow aRc$   $cR^{-1}b \text{ \& } bR^{-1}a \Rightarrow cR^{-1}a$

(b)  $R \cap S$

(c)  $R \circ R$   $\times$

(d)  $R \circ S$   $\times$

### Problem 2.

Let  $R_1$  and  $R_2$  be two equivalence relations on a set,  $A$ . Prove or give a counterexample to the claims that the following are also equivalence relations:

(a)  $R_1 \cap R_2$ .  $\checkmark$

(b)  $R_1 \cup R_2$ .  $a R_1 b \text{ \& } \text{Not}(a R_2 b) \Rightarrow$

$a (R_1 \cup R_2) b$

### Problem 3.

Determine which among the four graphs pictured in Figure 1 are isomorphic. For each pair of isomorphic graphs, describe an isomorphism between them. For each pair of graphs that are not isomorphic, give a property that is preserved under isomorphism such that one graph has the property, but the other does not. For at least one of the properties you choose, *prove* that it is indeed preserved under isomorphism (you only need prove one of them).

### Problem 4.

Let's say that a graph has "two ends" if it has exactly two vertices of degree 1 and all its other vertices have degree 2. For example, here is one such graph:

**Figure 1** Which graphs are isomorphic?

(a) A *line graph* is a graph whose vertices can be listed in a sequence with edges between consecutive vertices only. So the two-ended graph above is also a line graph of length 4.

Prove that the following theorem is false by drawing a counterexample.

**False Theorem.** Every two-ended graph is a line graph.

(b) Point out the first erroneous statement in the following bogus proof of the false theorem and describe the error.

*Bogus proof.* We use induction. The induction hypothesis is that every two-ended graph with  $n$  edges is a path.

**Base case** ( $n = 1$ ): The only two-ended graph with a single edge consists of two vertices joined by an edge:

Sure enough, this is a line graph.

**Inductive case:** We assume that the induction hypothesis holds for some  $n \geq 1$  and prove that it holds for  $n + 1$ . Let  $G_n$  be any two-ended graph with  $n$  edges. By the induction assumption,  $G_n$  is a line graph. Now suppose that we create a two-ended graph  $G_{n+1}$  by adding one more edge to  $G_n$ . This can be done in

should be  $\forall G_{n+1}$

only one way: the new edge must join an endpoint of  $G_n$  to a new vertex; otherwise,  $G_{n+1}$  would not be two-ended.

Clearly,  $G_{n+1}$  is also a line graph. Therefore, the induction hypothesis holds for all graphs with  $n + 1$  edges, which completes the proof by induction.
